

18.06 Problem Set 4

Due Wednesday, Oct. 11, 2006 at 4:00 p.m. in 2-106

Problem 1 Monday 10/2

Consider the eight vectors $\begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$, $\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$, $\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$, \dots , $\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$.

- List all of the one-element, linearly dependent sets¹.
- What are the two-element, linearly dependent sets?
- Find a three-element set spanning a subspace of dimension three. Can you find a three-element set spanning a subspace of dimension two? One? Zero?
- Which four-element sets are linearly dependent? Explain why.

Problem 2 Monday 10/2

Consider the matrix $A = \begin{bmatrix} 1 & 0 & a \\ 2 & -1 & b \\ 1 & 1 & c \\ -2 & 1 & d \end{bmatrix}$.

- Which vectors $\begin{bmatrix} a \\ b \\ c \\ d \end{bmatrix}$ will make the columns of A linearly dependent?
- Which vectors $\begin{bmatrix} a \\ b \\ c \\ d \end{bmatrix}$ will make the columns of A a basis for $\left\{ \begin{bmatrix} x \\ y \\ z \\ w \end{bmatrix} : y + w = 0 \right\}$?
- For $\begin{bmatrix} a \\ b \\ c \\ d \end{bmatrix} = \begin{bmatrix} 1 \\ -2 \\ 5 \\ 2 \end{bmatrix}$, compute a basis for the four subspaces.

Problem 3 Monday 10/2

Do Problem #5 from section 3.5 in your book.

Problem 4 Monday 10/2

Do Problem #24 from section 3.5 in your book.

Problem 5 Monday 10/2

Do Problem #37 from section 3.5 in your book.

Problem 6 Monday 10/2

Do Problem #19 from section 3.6 in your book.

¹That is, a collection, list, or sequence of vectors (“set”: $S = \{u, v, \dots\}$) containing exactly one vector (“one-element”: so $S = \{u\}$) and that sequence is not linearly independent. (*the matrix A having columns u, \dots , is not \dots ?*) Technically, a set of vectors is different from a sequence of vectors in that (a) order doesn’t matter, and (b) duplicates don’t count (for example, $\{u, v\} = \{v, u\} = \{u, v, u, u\}$ are all the same set, with two elements u, v) — don’t worry about the technical definition if you don’t already know it, though. If you want, you may pretend “set” here means “sequence” or “list” of vectors.

Problem 7 Monday 10/2

Consider the matrix $A = \begin{bmatrix} 1 & 0 & 0 \\ 2 & 1 & 0 \\ 4 & -3 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 0 & 3 \\ 0 & 0 & 1 & 4 \\ 0 & 0 & 0 & 0 \end{bmatrix}$.

- (a) What is the rank of A ? What are the dimensions of the four subspaces?
- (b) Give a basis for each of the four subspaces.
- (c) Now, for each of the four subspaces, find the set of equations that all vectors in the subspace must satisfy. (For example, if $Ax = b$ for some x , what are the conditions on the components b_i of b ?)

- (d) Give the complete solution to $A^T y = \begin{bmatrix} 0 \\ 0 \\ 1 \\ 4 \end{bmatrix}$.

Problem 8 Monday 10/2

Using Matlab, take some random 3-by-3 matrices (try using the `rand(m,n)` function) and look at their four subspaces. (A convenient way to calculate the subspaces is the `fourbase.m` teaching code; type in `type fourbase` at the Matlab prompt for information on how to use it.²) What are the dimensions of the four subspaces for a “typical” 3-by-3 matrix? Can you explain why? (*Hint: what are the odds a pivot is exactly zero?*)

Now try 3-by-5 matrices. What are the dimensions of the four subspaces now? Now guess what dimensions the four subspaces of a random m -by- n matrix will most likely have.

Problem 9 Friday 10/6

- (a) Find an ~~adjacency~~ incidence³ matrix A for the graph above.
- (b) Find one solution to $Ax = 0$ and two linearly independent solutions to $A^T y = 0$.
- (c) What conditions on the components of b do we need for $Ax = b$ to have a solution? Tell which of Kirchhoff's laws this illustrates. What are the “currents”? What are the “voltages”?
- (d) Compute $A^T A$. You get positive numbers on the diagonal — these numbers count the number of _____ each node has. When are the off-diagonal entries -1 , and when are they zero?
- (e) What is $N(A^T A)$? Why does $A^T Ax = f$ have a solution only when $f_1 + f_2 + f_3 + f_4 = 0$?

²If you need to download the file `fourbase.m` from the Web site, don't forget to put it in the current directory where Matlab can find it.

³Thanks to J. Tang for the correction!
