1 (20 pts.) Find all solutions to the linear system

$$x + 2y + z - 2w = 5$$

$$2x + 4y + z + w = 9$$

$$3x + 6y + 2z - w = 14$$

**2 (30 pts.)** In class, we learned how to do “downwards” elimination to put a matrix  $A$  in upper-triangular (or echelon) form  $U$ : not counting row swaps, we subtracted multiples of pivot rows from subsequent rows to put zeros below the pivots, corresponding to multiplying  $A$  by elimination matrices.

Instead, we could do elimination “leftwards” by subtracting multiples of pivot columns from leftwards columns, again to get an upper-triangular matrix  $U$ . For example, let:

$$A = \begin{pmatrix} 7 & 6 & 4 \\ 6 & 3 & 12 \\ 2 & 0 & 1 \end{pmatrix}$$

We could subtract twice the third column from the first column to eliminate the 2, so that we get zeros to the left of the “pivot” 1 at the lower right.

- (i) Continue this “leftwards” elimination to obtain an upper-triangular matrix  $U$  from the  $A$  above, and write  $U$  in terms of  $A$  multiplied by a sequence of matrices corresponding to each leftwards-elimination step.
- (ii) Suppose we followed this process for an arbitrary  $A$  (not necessarily square or invertible) to get an echelon matrix  $U$ . Which of the column space and null space, if any, are the same between  $A$  and  $U$ , and why?
- (iii) Is the  $U$  that we get by leftwards elimination always the same as the  $U$  we get from ordinary downwards elimination? Why or why not?

**3 (20 pts.)** Determine whether the following statements are true or false, and explain your reasoning.

(♣) If  $A^2 = A$ , then  $A = 0$  or  $A = I$ .

(◇) Ignoring row swaps, any invertible matrix  $A$  has a “UL” factorization (as an alternative to LU factorization):  $A$  can be written as  $A = UL$  where  $U$  and  $L$  are some upper and lower triangular matrices, respectively.

(♠) All the  $2 \times 2$  matrices that commute with  $A = \begin{pmatrix} 1 & 3 \\ 2 & 0 \end{pmatrix}$  (i.e. all  $2 \times 2$  matrices  $B$  with  $AB = BA$ ) form a vector space (with the usual formulas for addition of matrices and multiplication of matrices by numbers).

(♡) There is no  $3 \times 3$  matrix whose column space equals its nullspace.

4 (30 pts.) The following information is known about an  $m \times n$  matrix  $A$ :

$$A \begin{pmatrix} 1 \\ -2 \\ 0 \\ 1 \end{pmatrix} = \begin{pmatrix} 2 \\ 4 \end{pmatrix}, A \begin{pmatrix} 0 \\ 2 \\ 1 \\ 3 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}, A \begin{pmatrix} 2 \\ 0 \\ 0 \\ 1 \end{pmatrix} = \begin{pmatrix} 5 \\ 10 \end{pmatrix}, A \begin{pmatrix} 3 \\ 2 \\ 0 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 2 \end{pmatrix}.$$

( $\alpha$ ) Show that the vectors  $\begin{pmatrix} 1 \\ -2 \\ 0 \\ 1 \end{pmatrix}, \begin{pmatrix} 0 \\ 2 \\ 1 \\ 3 \end{pmatrix}, \begin{pmatrix} 2 \\ 0 \\ 0 \\ 1 \end{pmatrix}, \begin{pmatrix} 3 \\ 2 \\ 0 \\ 0 \end{pmatrix}$  form a basis of  $\mathbb{R}^4$ .

( $\beta$ ) Give a matrix  $C$  and an invertible matrix  $B$  such that  $A = CB^{-1}$ .

(You *don't* have to evaluate  $B^{-1}$  or find  $A$  explicitly. Just say what  $B$  and  $C$  are and use them to reason about  $A$  in the subsequent parts.)

( $\gamma$ ) Find a basis for the null space of  $A^T$ .

( $\delta$ ) What are  $m$ ,  $n$ , and the rank  $r$  of  $A$ ?
